Occupational Health: Lab Acquired Illness, Exposure, Releases, and Consequences

USDA-ARS 2nd International Biosafety & Biocontainment Symposium  Alexandria, VA
Sue A. Tolin
Professor Emerita, Plant Pathology, Virginia Tech

February 6, 2013
Risk Assessment and Biosafety of Plant Pathogens in the Laboratory

- Exposure can occur during lab procedures of pathogen isolation and culturing, common diagnostic procedures in plant disease clinics and classrooms
  - Inhalation of airborne spores can initiate mycoses
  - Allergic reactions are not well-documented

- Are biosafety protocols followed?
  - Plant pathogens are Class 1
  - APHIS regs don’t address risk to humans
Are there risks?

- Biological Safety Considerations for Plant Pathogens and Plant-associated Microorganisms of Significance to Human Health
  - Anne Vidaver, Sue Tolin and Patricia Lambrecht
  - A Chapter In: Biological Safety, Fifth Edition
    - First in Fourth Edition
Cross-kingdom microbes causing emerging human diseases

  - **Anthroponoses**: transmissible between humans
  - **Zoonoses**: transmissible to humans from animals
  - **Sapronoses**: transmissible to humans from an environmental source (organic matter, soil, plant)
    - But, sapronoses is also used for diseases whose source is an abiotic substrate (non-living)

- **Phytoses**: used by CDC (Tauxe presentations)
  - Phytonoses would be consistent with Hubalek, for diseases transmissible to humans from plant materials
Comparing bacteria and fungi causing diseases of humans and with those associated with plants

- Greater efforts are on human pathogens associated with plants as contaminants
- Common gene sequence motifs
  - Not well represented in literature
- Pathogenicity factors in common
  - Type III secretion pathways in pseudomonads
- Fungi have commonalities structurally, morphologically, biochemically, and genetically
Comparing safety considerations for bacteria and fungi causing diseases of humans and plants

- Humans: CDC classifies according to risk categories, with recommended safety levels
- Plant pathogens are generally not regarded as posing risks to humans and needing safe practices for reducing worker exposure
  - specimen examination
  - culturing and diagnosis
  - inoculation of plants
- USDA emphasis is on preventing introduction into the environment of organisms requiring permits
Bacteria

- Over 500 spp. isolated from humans
  - 5% are plant pathogens or biocontrol agents
- 28 bacterial species affect humans
  - 7 gram positive
    - 3 Bacillus spp.
  - 21 gram negative
### Selected Cross-species Bacteria

</table>
Cross-over bacterial pathogens that infect plants and people (phytoses)

Pumpkin patch affected by yellow vine disease, 1992

From Tauxe, 2006 (CDC)

Causal Agent: *Serratia marcescens*

Fungi

- About 300 species reported isolated from humans with infectious systemic diseases
- 12 or more have been associated with serious diseases
- At least 50 are known as plant pathogens
- Most are ascomycetes (phylum Ascomycota)
- Mortality rate higher than for bacteria
- Does not include those associated with mycotoxicoses, acquired from food consumption
Genera of Plant Pathogenic Fungi

- Many associated with allergic asthma, others
- Most common with several species are:
  - *Alternaria*, *Aspergillus*, *Bipolaris*, *Bipolaris*, *Colletotrichum*, *Curvularia*, *Fusarium*
- 12 other genera with single species
### Selected Cross-species Fungi

</table>
Meningitis acquired from injection

- Contamination with:
  - *Exserohilum rostratum*
    - A brown-black mold
- One case each with:
  - *Aspergillus fumigatus*
  - *Cladosporium* spp.

Closely related to plant pathogens:

* Drechslera
* Bipolaris
* (Helminthosporum)
Fungal contaminants

- Fungal meningitis
- Betamethasone
  - *Penicillium* sp.
  - *Cladosporium* sp.
- Triamcinolone
  - *Penicillium* sp.
  - *Aspergillus tubingensis*
  - *A. fumigatus*
## Selected Fusarium Species

Looking at Viruses

- Plant viruses in cross-kingdom taxa that replicate in arthropod vectors (thrips, aphids, leafhoppers)
  - One genus of *Bunyaviridae* (*Tospovirus*)
  - Two genera in *Rhabdoviridae* (*Cytorhabdovirus, Nucleorhabdovirus*)
  - Three genera in *Reoviridae* (*Phytoreovirus, Fijivirus, Oryzavirus*)

- Likely candidates for human diseases, but none reported. Other viruses in these families have mosquito or tick vectors and cause severe human encephalitis and hemorrhagic fevers.
Viruses in human fecal matter

- Noroviruses found, but about half are plant viruses
  - Those that are stable in soil, water, and in non-living plant sources
    - *Tobamovirus* (TMV, *Pepper mild mottle virus*)
    - *Secoviridae*, *Tombusviridae*, *Tymoviridae*
- Metagenomics has associated viral sequences with symptoms in humans, suggesting a direct or indirect pathogenic role of ingested viruses.
  - specific immune responses, fever, abdominal pains, and pruritus.
Pepper Mild Mottle Virus, a Plant Virus Associated with Specific Immune Responses, Fever, Abdominal Pains, and Pruritus in Humans

Philippe Colson¹,², Hervé Richet¹, Christelle Desnues¹, Fanny Balique¹,⁶, Valérie Moal², Jean-Jacques Grob⁴, Philippe Berbis⁵, Hervé Lecoq⁶, Jean-Robert Harlé⁷, Yvon Berland³, Didier Raoult¹,²

Conclusions: Our study identified a local source of PMMoV and linked the presence of PMMoV RNA in stool with a specific immune response and clinical symptoms. Although clinical symptoms may be imputable to another cofactor, including spicy food, our data suggest the possibility of a direct or indirect pathogenic role of plant viruses in humans.
Risk potential for lab personnel

- Risk increasing activities
  - Large scale cultures
  - Aerosol-generating procedures
  - Use of needles and syringes
  - Direct contact with skin wounds

- Risk reduction practices
  - Disposable gloves
  - Minimize aerosol generation
  - Filter respirators

- Higher risk individuals
  - Immunocompromised adults (transplant recipients, immunodeficiencies)
  - Persons with allergic sensitivities
What laboratories are at risk?

- Plant Disease Diagnostic Lab clinicians have recognized that human pathogens in plants pose risk factors.

- What about plant pathogens?
  - As environmental exposures?

- Risks to plant pathologists in field studies?
  - To students in classes?
THANK YOU!
