After chemical treatment of soil in fields of *Phaseolus vulgaris*, relations among soil components were dictated by nematode guilds, whereas after organic treatment, these were dictated by biochemical variables report P. D. Kapagianni and associates at Aristotle University, Greece. (Appl. Soil Ecol. 44:67-74, 2010)

Treatment of chili with yeast antagonist reduced disease from *Colletotrichum capsici* and enhanced activities of three enzymes and phytoalexin in chili report N. Nantawanit and associates at Mahidol University, Thailand. (Biol. Control 52:145-152, 2010)

*Tomato severe rugose virus* was isolated from *Nicandra physaloides* and was transmitted by *Bemisia tabaci* to tomato report J. C. Barbosa and associates at Universidade de Sao Paulo, Embrapa Horticalis, and Centro de Citricultura Sylvio Moreira, Brazil. (J. Gen. Plant Pathol. 75:440-443, 2009)

Protein-coated microspheres are useful to study pathogen transport in groundwater as surrogates for pathogens in terms of attenuation and behavior report L. Pang and associates at the Institute of Environmental Science & Research, Ltd. and University of Otago, New Zealand; and University of Colorado. (J. Environ. Qual. 38:2210-2217, 2009)

The siderophore pyoverdine and quorum-sensing system of *Pseudomonas syringae* are indispensable for virulence in tobacco infection report F. Taguchi and associates at Okayama University, Japan. (J. Bacteriol. 192:117-126, 2010)

A peptide antibiotic from *Pantoea agglomerans* active against *Erwinia amylovora* and *Pseudomonas syringae* was described by U. F. Sammer and associates at Friedrich Schiller Universität, Hans Knoll Institute, Technische Universität München and Dortmund, and Max Planck Institute, Germany. (Appl. Environ. Microbiol. 75:7710-7717, 2009)

Incidence and severity of Phomopsis stem canker on sunflower were related to canopy, humidity, plant density, and nitrogen fertilization report P. Debaeke at INRA, UMR AGIR, and DRAAF-SRAL Midi-Pyrénées, France. (Field Crops Res. 115:50-60, 2010)

Three species of *Armillaria* in the Arkansas Ozarks were associated with death from oak decline coupled with the red oak borer report M. B. Kelley and associates at the University of Arkansas. (For. Pathol. 39:397-404, 2009)

*Tomato torrado virus* (awaiting ICTV recognition) was biologically and molecularly characterized in Polish isolates report H. Pospieszny and associates at Plant Protection-National Research Institute, Poland. (J. Phytopathol. 158:56-62, 2010)
